

SaaS Control Center

System Custom Columns & Advanced Channel Rules Report

User-Configurable Grid Fields, Custom Overrides & Cost Breakdown Logic

Prepared For: Holiday Homes SaaS Onboarding & Operations Teams

Date: June 3, 2026

Status: Completed, Validated & Deployed

Environment: Vercel Production & Desktop Recovery Folder

1. Executive Summary

This progress report compiles details on two main feature systems introduced in the SaaS Control Center: User-Configurable Custom Grid Columns on Properties Management, and the OTA Channel Rules engine with custom dynamic rate overrides.

- **User-Configurable Custom Columns:** Allowed onboarding and reservations teams to define custom columns (e.g. WiFi Details, Keybox Codes) on the fly, editing cell values inline in the grid like an Excel sheet and viewing/saving them inside the details page without requiring database migrations.
- **OTA Rules & If/Then Overrides:** Integrated Excel import parser with keyword scoring and manual mappings, alongside an interactive override builder (e.g. IF stay duration > 28 nights, THEN override Airbnb commission to 12%) fully tied into the discrepancy check engine.
- **Layout & Cost Mapping Fixes:** Streamlined dashboard to two columns, optimized navigation for mobile devices, corrected the stay cost calculations mapping to raw accommodation revenue, and aligned staff profile keys between platforms.

All updates compile cleanly, type-check successfully, and are fully deployed in the production environment.

2. Technical Details & Storage Strategy

To avoid complex schema changes, we utilized the existing JSON extraDetails column on the Property database model to store custom fields. The column structure definitions are preserved in local storage allowing teams to manage visual columns separately.

Component / Area	Storage Location	Key Mechanics
Custom Column Config	localStorage	Saved under hhs_custom_property_columns
Column Visibilities	localStorage	Saved under hhs_visible_property_columns
Property Values	Database JSON	Stored as fields in extraDetails JSON object
OTA Channel Rules	localStorage	Saved under hhs_channel_rules

3. Scope of Page Modifications

A. Properties Grid Page (properties/page.tsx)

Modified column definition rendering to merge standard and custom column inputs. Added inline editing overlay: cells transform into inline text inputs on click with green check/red cross buttons, and show a pencil icon on hover in read mode. Added column creation/deletion widgets inside the columns menu.

B. Property Details (properties/[id]/page.tsx)

Passed custom columns config to OverviewTab and rendered a beautifully styled 'Additional Details' card detailing all values. Extended the Edit Modal form inputs so users can modify custom properties alongside standard details in a cohesive form.

C. Properties API Update (api/properties/[id]/route.ts)

Updated the PUT endpoint logic to safely merge incoming custom values with existing extraDetails keys in the database, resolving issues where standard validation warning arrays (e.g. missingRequiredFields) previously overrode and wiped out custom properties data.

4. Verification & Production Deploy

The application compiled successfully without TypeScript or Next.js build errors. The Vercel CLI deployed the final compiled artifact directly to production:

```
$ npx.cmd vercel --prod --yes
Retrieving project ...
Deploying waleed-s-projects16/holiday-homes-saas
▲ Production:   https://holiday-homes-saas.vercel.app
Building ...
✓ Compiled successfully in 13.5s
✓ Generating static pages (36/36) in 456ms
Deployment completed! Main domain aliased.
```

Backup Restoration Details

To safeguard all implementation files, a full recursive copy of all codebases (excluding node caches and build files) was executed using robocopy. This is stored directly on the desktop. The files in this backup folder are read-only/untouched and preserved for safe recovery.
